

## Software Setup

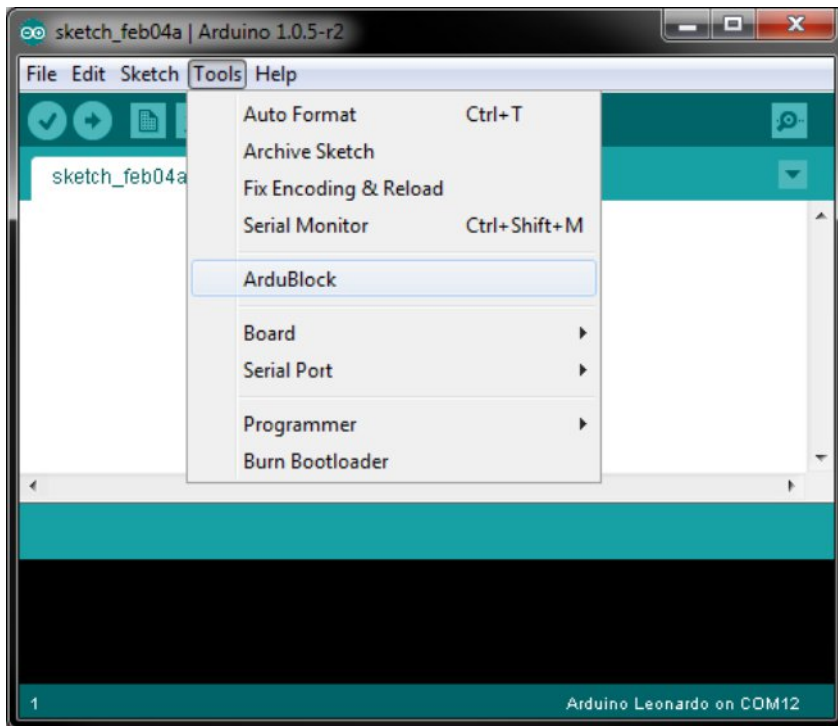

The software students will use during this module comes packaged as a single folder in order to make using it as easy as possible. When setting a computer up to use our software, simply open the MUzECS folder and double click on Arduino. This will open the Arduino development environment, which is how the code will deploy the Arduino hardware.

Once this program is open, use the menu at the top of the program to select Tools > Board > Arduino Leonardo. This is the Arduino we will be using for the course.

Next, select Tools > Ardublock. This will open Ardublock, the program in which students will write their block-based programs.

Once this is open, students are ready to get to work and write code.
